TO RUN PROGRAM:
1) Launch the JOB_SELECTOR.exe file

TO SEARCH:
Use the dropdown menu to choose the search filter. Enter the search input into the corresponding textbox to the right of the menus. To add another filter, click the button labeled "add filter" to show more options. Click the show listings button to see which jobs are available for that search.

TO FAVORITE:
Click the row number on the far left of the listings to select a row, then click the favorite button. **WARNING:** selecting the favorite button without a listing selected will cause the program to crash.

TO SEE FAVORITES:
Use the view account button to see the listings you've favorited. Select the show button to see the current listings that are in the favorites table. To delete a listing, select a row like before and click the delete button. Press the show button to see the updated table. To add to the comments column, double click the comments box in the row and add text. Click the row number of the changed comments cell and click update. Select show to see the updated table.
WARNING: As mentioned previously, pushing delete or update without specifying a row will cause the program to crash. This is a flaw within the qt application maker.
